

Data pours more cold water on the warmists' claims

PRIME Minister Julia Gillard insists "the science is in". The planet is warming dangerously -- and man is to blame.

Here's one sign that Gillard lies.

Check where Chief Climate Commissioner Tim Flannery lives.

Flannery in 2006 warned we could be on the brink of causing the seas to rise by 25m if we did not slash our emissions.

"Picture an eight-storey building by a beach, then imagine waves lapping its roof," he said dramatically.

"So anyone with a coastal view from their bedroom window or kitchen window is likely to lose their house as a result of that change."

So how terrifying it must be for Flannery as he gets his breakfast each morning to look up and see the estuarine waters of the Hawkesbury, just 5m from his waterfront home on Coba Point.

Why hasn't he sold up and moved to higher ground? Is it because even he doesn't believe his absurd scare?

But evidence that the warming theory is hokum goes far beyond the fact that the professional alarmists don't live as they preach.

Here's just some of the science news and views from this past month that nail Gillard's deceit.

The science journal Remote Sensing now says NASA satellite data over the past decade shows our atmosphere releases much more heat into space than alarmist computer models predicted, suggesting the planet won't warm anything like we're warned.

Science magazine says that NASA scientists rechecking ice-monitoring data from eastern Antarctica say reports of a big melt from the continent have been exaggerated.

The world's leading climate scientist, Prof Richard Lindzen of the Massachusetts Institute of Technology, told me "since 1995...there hasn't been much warming, certainly not that can be distinguished from noise".

Australian physicist Prof Brian O'Brien, who worked on the Apollo moon missions, told the ABC "it was certainly not proven" that man was largely to blame for any warming and the danger "had been wildly exaggerated".

Prof Peter Ridd, head of physics at James Cook University, has demanded sceptics be funded to check warmist claims because "I have as much faith in (their) science as I did in the police system in Queensland in the 1980s".

A STUDY by Phil Watson, a coastal researcher with the New South Wales Office of Environment and Heritage, shows the centuries-long rise in sea levels has slowed, now increasing at "a reducing rate".

Meanwhile, Charles Monnett, the US federal biologist whose headline-grabbing claim that global warming was drowning polar bears was recycled in Al Gore's *An Inconvenient Truth*, has now been suspended while authorities investigate allegations of scientific misconduct in the study that made him famous.

The "science is in"? Who says so lies, and until I see Flannery move to high ground, clutching cats for warmth, I'd say he secretly thinks so, too.
